

DeLight controller

DeLight is event lighting control made easy. No experience necessary. We wanted a lighting controller that could create atmospheric lighting without needing to program a lighting board, or hire a lighting director. DeLight is a customized tablet App combined with a wifi hardware light controller that hides neatly in a small case. Connect it to lights, or to any DMX RGB or RGBW lights, set the light's addresses, launch the app, and it works. Set a range of hues, saturations and brightnesses; control the rate of change, control the randomization of colour, control the rate of fade, all with the sliders on the app.
